Board View — Proof Before Consequence

Level 1 — $18M Wire Release • Banking Core Payment Governance

What happened

An AI-enabled workflow proposed: release an $18,000,000 wire to a new beneficiary.

Judgement Spine identified the Moment That Matters: Final settlement release under uncertain sanctions screening — and enforced an execution-time outcome: BLOCK.

Material risk prevented

Prevented an irreversible release under sanctions ambiguity — avoiding regulatory breach, remediation cost, and reputational damage.

Why AI changes the risk

AI screening and risk scoring can clear or block transactions at machine speed — small signal shifts can move millions in seconds.

Automation compresses the time window for dual control, escalation, and corroboration.

When a probabilistic model output becomes a deterministic release action, the liability moves from ‘model quality’ to ‘reliance authorisation’.

Operational impact

Funds did not move until named Treasury + AML authority could approve. Re■screening and case routing triggered automatically, with a complete evidence record written before any clearance.
